# 1 CFFDRS System Overview

This guide is intended as a reference for US users who may have reason to work with the system in the United States, where English units are primarily used. Keep in mind that the Canadian Forest Service has produced the definitive selection of reference publications and tools.

The Canadian Forest Fire Danger Rating System (CFFDRS) was first conceived in 1968. The Fire Weather Index (FWI) system was developed and introduced across Canada in 1970. The Fire Behavior Prediction (FBP) system was released in 1984. The Fire Occurrence Prediction (FOP) system and Accessory Fuel Moisture system are still in development, with several regional modules operational at this time

Though this guide attempts to be faithful to the models embedded in CFFDRS, there are a number of adaptations to the standard depictions found in materials produced by the Canadian Forest Service

- Most important among these is the use of English units instead of the standard metric units employed in the system internationally
- CFFDRS models and tools do not expressly identify the relationship between standard wind measurements (10 meters sensor height) used and field measurements at eye level. The relationship between “airport”, “forestry” and winds measured at other heights (e.g. 6 ft for eye level) is taken from Lawson & Armitage (2008). Users are encouraged to interpret the winds as measured and apply them appropriately for the model used

## 1.1 Key References & Training Resources

The content included in this reference is based largely on these references with several graphics and flow charts drawn directly from them.

Most of these references, resources, and tools can be found at

## 2 Fire Weather Index (FWI) System

### 2.1 System Overview

Analogous in concept to the National Fire Danger Rating System (NFDRS), the Fire Weather Index System depends solely on weather readings

CFFDRS calculates FWI codes and indices based on a single “standard” fuel type that can be described as a generalized pine forest, most nearly jack pine and lodgepole pine

The Fire Weather Index System calls for weather observations to be collected from a standard observation site and time. Location standards can be found in the “Weather Guide for the Canadian Forest Fire Danger Rating System” (Lawson and Armitage, 2008). The system calls for observations to be taken at “solar” noon, when the sun is at its peak directly overhead.

There are three (3) ***fuel moisture codes*** calculated from these basic weather observations. Unlike the NFDRS fuel moistures, the FWI fuel moisture codes increase as fuels get drier. Like other accounting systems, the FWI system combines knowledge of yesterday's (or last hour's) fuel moisture conditions with the influence of air temperature, atmospheric moisture, wind, and precipitation since then.

- The ***Fine Fuel Moisture Code (FFMC)*** represents fuel moisture of forest litter fuels under the shade of a forest canopy. It is intended to represent moisture conditions for shaded litter fuels, the equivalent of 16-hour timelag. It ranges from 0-101. Subtracting the FFMC value from 100 can provide an estimate for the equivalent (approximately 10h) fuel moisture content, most accurate when FFMC values are roughly above 80.

- The **Duff Moisture Code (DMC)** represents fuel moisture of decomposed organic material underneath the litter. System designers suggest that it represents moisture conditions for the equivalent of 15-day (or 360 hr) timelag fuels. It is unitless and open ended. It may provide insight to live fuel moisture stress.
- The **Drought Code (DC)**, much like the Keetch-Byrum Drought Index, represents drying deep into the soil. It approximates moisture conditions for the equivalent of 53-day (1272 hour) timelag fuels. It is unitless, with a maximum value of 1000. Extreme drought conditions in the Eastern Upper Peninsula have produced DC values near 650.

Similarly, there are three (3) **fire behavior indices** intended to represent spread, fuel consumption/heat release, and fire intensity.

- The **Initial Spread Index (ISI)** is analogous to the NFDRS Spread Component (SC). It integrates fuel moisture for fine dead fuels and surface windspeed to estimate a spread potential. ISI is a key input for fire behavior predictions in the FBP system. It is unitless and open ended.
- The **Buildup Index (BUI)** is analogous to the NFDRS Energy Release Component (ERC). It combines the current DMC and DC to produce an estimate of potential heat release in heavier fuels. It is unitless and open ended. In Alaska and the Lake States, it is the primary indicator of season severity during the growing season.
- The **Fire Weather Index (FWI)** integrates current ISI and BUI to produce a unitless index of general fire intensity potential. It is analogous to NFDRS Burning Index. With dry fuel conditions, it is a key indicator of extreme fire behavior potential. Again, unitless and open ended.

### **Diurnal Variations**

There is an hourly implementation for the **Fine Fuel Moisture Code** that reflects the variability in fine fuel moisture as influenced by temperature and humidity changes. Using the corresponding, locally observed windspeed, updated values for **Initial Spread Index** and **Fire Weather Index** may also be produced.

Additionally, research in Ontario (Kidnie et.al, 2010) quantified the fuel moisture trends for grass fuels and established a grass fuel moisture model that is produced only with hourly data.

### **Seasonal Start-up and Resumption after Interruption in Observations**

Daily records are generally started as soon as there is measurable fire danger in the spring. In Alaska, this is defined as the third day after snow has essentially left the area to which the fire danger rating applies.

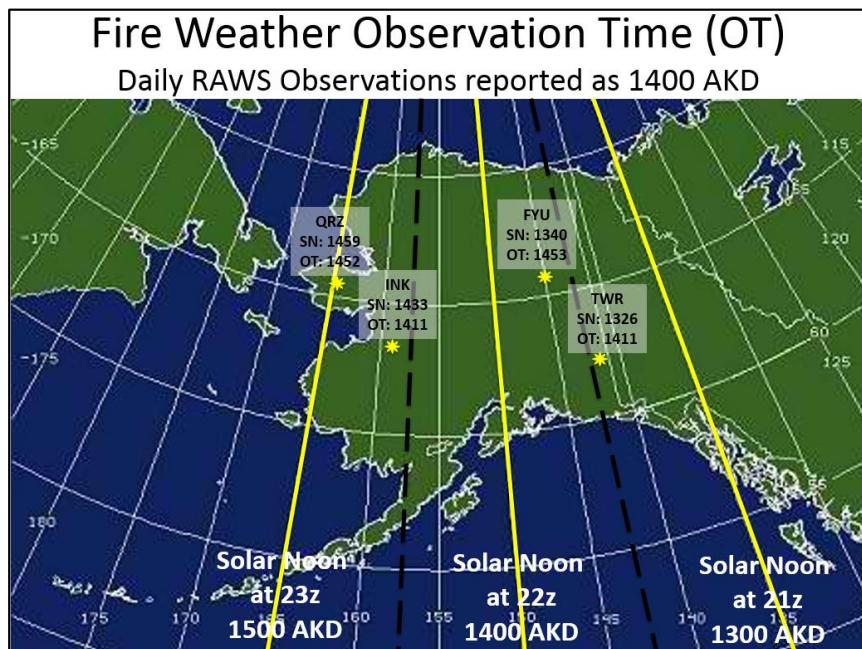

Default seasonal start-up values are 85 for FFMC, 6 for DMC, and 15 for DC.

If daily observations are interrupted during the season and missing observations cannot be estimated, fuel moisture codes must be estimated for the last day of missing observations and used as “yesterday” fuel moisture codes for the newly resumed weather observation.

## Observation Time in Alaska

All Alaska RAWS stations, regardless of their actual observation time, have their official observation time established as the last whole hour before the observation. In reality, each automated weather station is assigned a specific time (minute and second) to transmit its current observation. Examples of different actual observation times (OT) are shown on the map below.

Even with Alaska's large size, all daily Fire Weather Index values in the state are calculated from observations established as 1400 Alaska Daylight Savings Time (AKDT). As mentioned earlier, the FWI system is based on standard observations collected at "solar" noon, when the sun is directly overhead. The following graphic shows the relationship between the actual "solar noon" (SN) time and the actual observation time for several RAWS locations in the state.

Though there has been much discussion about the observation time for RAWS locations in western Alaska, the examples shown here indicate that the biggest gaps may exist in eastern Alaska. The Fort Yukon example shows that the observation time of 1453 AKDT is 1 hour and 13 minutes after "solar" noon (1340) at that location.

Van Wagner (1987) documented the effects of latitude on the fuel moisture codes, identifying significant discrepancies in FFMC that "occur because the time of maximum temperature and minimum relative humidity in *high summer* is progressively later as latitude increases." At that time, he suggested that daily observations could be delayed in the far north to eliminate much of the difference that occurs.

## 2.2 Alaska Interagency FWI Interpretation Thresholds

These thresholds are used on the Alaska Interagency Coordination Center web space to provide interpretations to FWI observations and forecasts each day. Though they give insight to overall potential across landscapes and areas of responsibility, they need to be combined with specific fuels and terrain for the site using the Fire behavior Prediction (FBP) System to produce fire behavior interpretations when evaluating a specific fire situation.

Class	LOW	MOD	HIGH	VHIGH	EXT	Interpretation
Max Temp	<50°	50° to 59.9°	60° to 69.9°	70° to 79.9°	80°+	Fire intensity and crown fire potential
Min RH	51% to 100%	41% to 50%	31% to 40%	21% to 30%	<20%	Fine fuel moisture and ignition potential
FFMC	0 to 79.9	80 to 85.9	86 to 88.9	89 to 91.9	92+	Below 74, little chance of ignition or surface fire spread with an open flame. Active spread in light fuels at 80. Ignition potential high at 90 and extreme fire behavior expected at 92.
DMC	0 to 39.9	40 to 59.9	60 to 79.9	80 to 99.9	100+	Duff layer not involved below 20. Influence of duff on surface fire noticeably increases at 40. Extreme fire behavior becomes possible above 60.
DC	0 to 149.9	150 to 349.9	350 to 399.9	400 to 449.9	450+	Minimal significant ground fire below 300.
ISI	0 to 1.9	2 to 4.9	5 to 7.9	8 to 10.9	11+	Expected spread potential. Used in fire behavior predictions.
BUI	0 to 39.9	40 to 59.9	60 to 89.9	90 to 109.9	110+	Fuel availability and flammability. Seasonal severity. Used in Fire Behavior Predictions.
FWI	0 to 8.9	9 to 17.9	18 to 27.9	28 to 34.9	35+	Fire intensity and extreme fire potential.
Daily Severity Rating (DSR)						A transformation of the FWI that emphasizes its higher values. Can be cumulated through the season to represent overall conditions.

## 2.3 Monthly Fire Weather Index (FWI) Record

Month      Year      Station/Zone      Elevation      Observer

## 2.4 Tables for the Fire Weather Index (FWI) System

### 2.4.1 Instructions

#### Daily CFFDRS Weather Observations

Manual observations may be taken with a belt weather kit, as long as the eye-level windspeed observation is adjusted to 10m Forestry/RAWS windspeed before the codes and indices are estimated.

Observed 1400 ADT weather elements include:

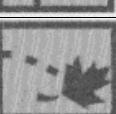

- Dry Bulb Temperature
- Relative Humidity
- 10m “Forestry” or RAWS windspeed and direction
- 24 hour accumulated precipitation total.

**Sudden Weather Changes during the Afternoon** may be accounted for by collecting a new set of observations and calculating a revised set of system codes and indices up to 1700 ADT. Do not include any of the rainfall that fell after the normal collection time of 1400 ADT.

The following table, adapted from the metric version in the [Field Guide for Predicting Fire Behavior in Ontario's Tallgrass Prairie](#) (Kidnie et.al.2010), shows the relationship among wind measurement or forecasts based on both the instrument height, the size of the opening, the variability of the terrain, and vegetation around the sensor. “Airport” locations are much larger and flatter openings than most found in wildland, or “Forestry” settings.

Forestry, RAWS 10m (mph)	Height of Wind Measurement/Estimate (in feet)									Airport or Fcst 10m (mph)	Fire Shape Length:Width	
	3	6	10	13	16	20	23	26	30		Open O-1,	Closed C,M,D,S
1	1	1	1	1	1	1	1	1	1	2	1.4	1.0
2	1	2	2	2	2	2	2	2	2	3	1.9	1.1
3	2	2	2	3	3	3	3	3	3	5	2.3	1.1

## Visual Surface (10m) Wind Estimate - Modified Beaufort scale

Class	Windspeed	Terminology		Visible Effect
0	Less than 1 mph	Calm		Calm, Smoke rises vertically
1	1 to 3 mph	Very Light Breeze		Leaves of quaking aspen in constant motion; small branches sway, tall grasses and weeds sway and bend with wind, wind vane barely moves
2	4 to 7 mph	Light Breeze		Trees of pole size in the open sway gently, Wind felt distinctly on face; leaves rustle; loose scraps of paper move, wind flutters small flag
3	8 to 12 mph	Gentle Breeze		Leaves, small twigs in constant motion; Tops of trees in dense stands sway; light flags extended
4	13 to 18 mph	Moderate Breeze		Trees of pole size in the open sway violently; whole trees in dense stands sway noticeably; dust is raised in the road.
5	19 to 24 mph	Fresh Breeze		Branchlets are broken from trees; inconvenience is felt in walking against wind
6	25 to 31 mph	Strong Breeze		Tree damage increases with occasional breaking of exposed tops & branches; progress impeded when walking against wind.
7	32 to 38 mph	Moderate Gale		Severe damage to tree tops; very difficult to walk into wind; significant structural damage occurs.
8	39 to 46 mph	Fresh Gale		Surfaced strong Santa Ana; intense stress on all exposed objects, vegetation, buildings; canopy offers virtually no protection
9	47 to 54 mph	Strong Gale		Slight structural damage occurs; slate blown from roofs
10	55 to 63 mph	Whole Gale		Seldom experienced on land; trees broken; structural damage occurs
11	64 to 72 mph	Storm		Very rarely experienced on land; usually with widespread damage
12	73 mph or more	Hurricane Force		Violence and destruction

## **Seasonal Startup of Calculations**

Daily FWI system calculations also require fuel moisture codes (FFMC, DMC, DC) from the previous day. At the start of each fire season, values for these codes must be assigned according to procedures established by the system managers. At least one of these three “startup” situation will be encountered and needs to be addressed properly:

- At the beginning of the fire season, “begin calculations on the third day after snow has essentially left the area to which the fire danger rating applies.”(Lawson and Armitage, 2008). In these cases, assign a value of 85 for FFMC, a value of 6 for DMC, and a value of 15 for DC except in situations where system managers wish to adjust the DC value for carryover drought from the previous season and/or precipitation deficits over the winter.
- For late-starting stations, the initial values for these three moisture codes must consider the weather influences that have already accumulated since the beginning of the season. Examine fuel moisture code values for several nearby stations and assign appropriate startup values for the late-starting station based on interpretation of current conditions at the startup location.
- If, during the season, weather observations are interrupted, either missing weather data will need to be provided or fuel moisture codes must be assigned for the day prior to the next weather observation.

### **Determine Daily Fine Fuel Moisture Code (FFMC)**

- Obtain yesterday's (or startup) FFMC.
- Determine if it rained at least 0.03inches in the 24 hours since yesterday's observation. If sufficient rainfall is measured, determine FFMC Raincode (Table 1) using the FFMC value from yesterday (or assigned at startup) and the rainfall amount recorded. This value is called the FFMC *Raincode*.
- Use either FFMC Raincode or yesterday's FFMC (if rainfall was insufficient) with DB Temp, RH and Wind recorded for today to determine today's daily FFMC (Table 2.a-k).

### **Estimate Duff Moisture Code (DMC)**

- Obtain yesterday's (or startup) DMC.
- Determine if it rained at least 0.06 inches in the 24 hours since yesterday's observation. If sufficient rainfall is measured, determine DMC Raincode (Table 3) using the DMC value from yesterday (or assigned at startup) and the rainfall amount recorded. This value is called the DMC *Raincode*.)
- With the DB Temp and RH recorded for today, use Table 4 to determine the [DMC] drying factor based on the current month. Add this drying factor value to either the DMC Raincode or yesterday's DMC (if rainfall was insufficient) to produce today's daily DMC.

### **Estimate Drought Code (DC)**

- Obtain yesterday's (or startup) DC.
- Determine if it rained at least 0.11 inches in the 24 hours since yesterday's observation. If sufficient rainfall is measured, determine DC Raincode (Table 5) using the DC value from yesterday (or assigned at startup) and the rainfall amount recorded. This value is called the DC *Raincode*.)
- With the DB Temp recorded for today, use Table 6 to determine the [DC] drying factor based on the current month. Add this drying factor value to either the DC Raincode or yesterday's DC (if rainfall was insufficient) to produce today's daily DC.

### **Determine Daily Initial Spread Index (ISI)**

- Use Table 7
- Lookup the daily ISI based on the FFMC and 10m windspeed determined earlier.

### **Estimate Buildup Index (BUI) for site conditions**

- Use Table 8.
- Lookup the BUI based on the DMC and DC determined earlier.

### **Determine Daily Fire Weather Index (FWI)**

- Use Table 9.
- Lookup the daily FWI based on the ISI and BUI determined earlier.

**Table 1. Fine Fuel Moisture Code (FFMC); Rain Code Estimation**

		24 HOUR RAINFALL TOTAL, INCHES (if 24 hour rainfall is less than 0.03 inches, Rain Code = Yesterday's FFMC)
